

July 30, 2016

I am a resident of (b)(6). I have lived in this area for the last 16 years. A lot of land is gone and I have seen poor practicing with the application of manure – they don't keep their setbacks around the irrigation wells or drainage ditches or direct conduits to ground water to be sink holes or drain tile outlets and inlets.

I drink my (b)(6) water, but not my (b)(6) water who lives close to the farm.

They are trying to do it the way the farmers did it in the old days – you can't do that with the commercial farmers. The ground is too porous. I believe that the Nutrient Management plan needs to be communicated to the applicators. We have to work off of the Management plan.

I am certified with the (b)(6), so I know.

I don't want to give my name because I work as an (b)(6) in the state of Wisconsin.

I feel that it is all education, laws and regulations. You need to know what is going on and you need to know what you are doing and do it well.

Too many end guns from the irrigators hit the roads here in Wisconsin. Its all about education.
